One folder per reason to change

Level 00 - repository map. Blue: MethaneWatch code. Red: evidence. Grey: infrastructure and support.

Folder	Why it exists, and why it is separate
`diagrams/`	Architecture diagrams from abstract to detailed. LaTeX/TikZ source plus rendered PDF and SVG, so design is reviewed in pull requests.
`docs/`	Decisions (ADRs), requirement traceability, work breakdown, runbook, model and dataset cards.
`configs/`	Experiments, release gates and the permission matrix as data. Reviewed and frozen like code, but changeable without a code edit.
`src/methanewatch/{core, domain, ports}`	Shared kernel, pure rules and interfaces. No file, network or cloud calls. Changes least, so everything else may depend on it.
`src/methanewatch/{data, models, training, evaluation, inference}`	The ML research chain behind one model interface, so a new architecture is one file plus one YAML.
`src/methanewatch/{verification, quantification, attribution}`	The science the report requires to be separate from segmentation: a mask is not a verified emission or a rate.
`src/methanewatch/evidence`	Integrity (hashes, provenance, signatures, audit chain) is not scientific correctness, so it is its own package.
`src/methanewatch/services`	Use cases that orchestrate the packages above through ports. The only place business flow lives.
`src/methanewatch/adapters`	The only code that imports boto3, pystac, cdsapi or touches disk. Swap LocalStack for AWS here and nowhere else.
`src/methanewatch/{api, workers, cli}`	Delivery: HTTP (FastAPI), event handlers (Beta), command line. Chooses adapters at start-up.
`web/`	React portal. Talks to the API over HTTP only, using a generated client, so it can be built against a mock.
`tests/`	unit, integration, e2e, ml, fixtures. Mirrors src/ so each package's tests are easy to find and own.
`infra/, docker/`	Terraform modules (Beta scaffold) and container images for api, trainer (CUDA) and web.
`notebooks/, scripts/`	Tutor demo notebook only; one-off helpers. Neither is imported by src/, so no logic hides in them.

Who owns which folder and file is in docs/assignments.md.
