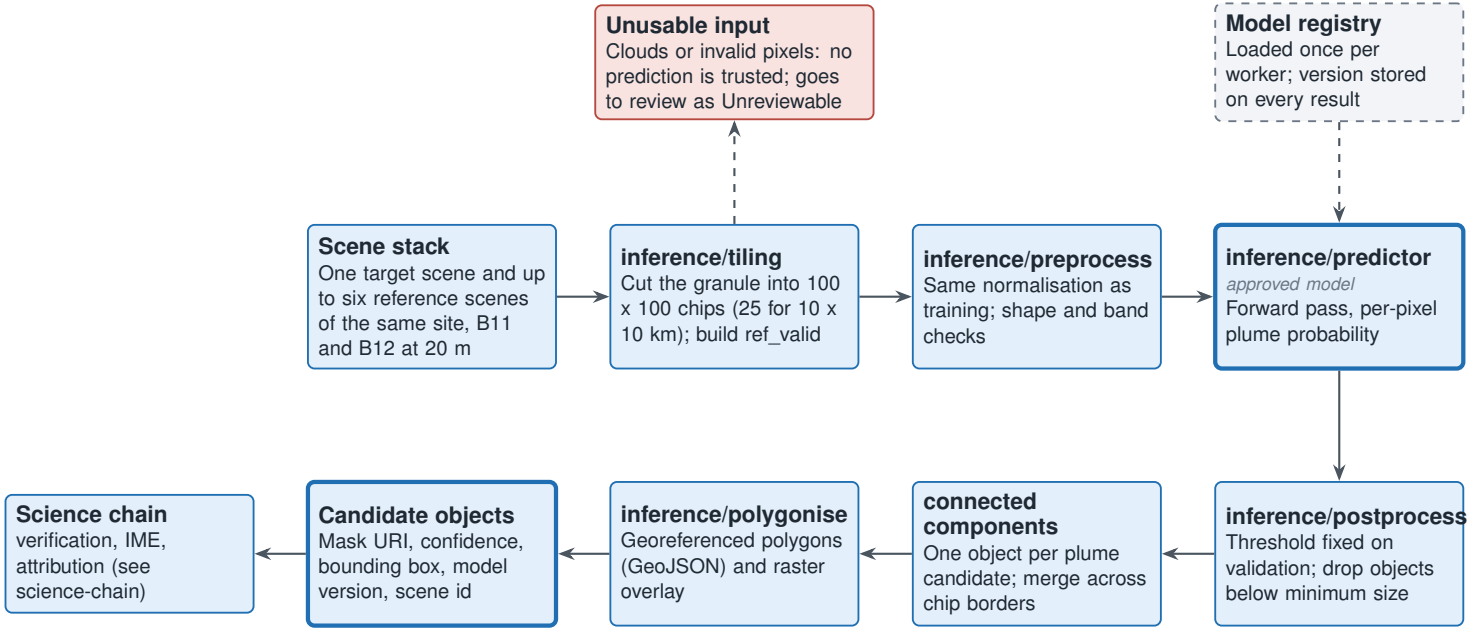
A granule is 25 chips; every chip carries its own validity mask

Level 02 - inference service. Same code path locally and in the Beta GPU worker; only the model file and the adapters change.



Target budget (NFR1): ingestion, preprocessing and inference for one 10 x 10 km granule within 15 minutes on a standard GPU instance, measured once all inputs are available. The 24 h figure is separate: satellite pass to candidate mask, a Beta target.
