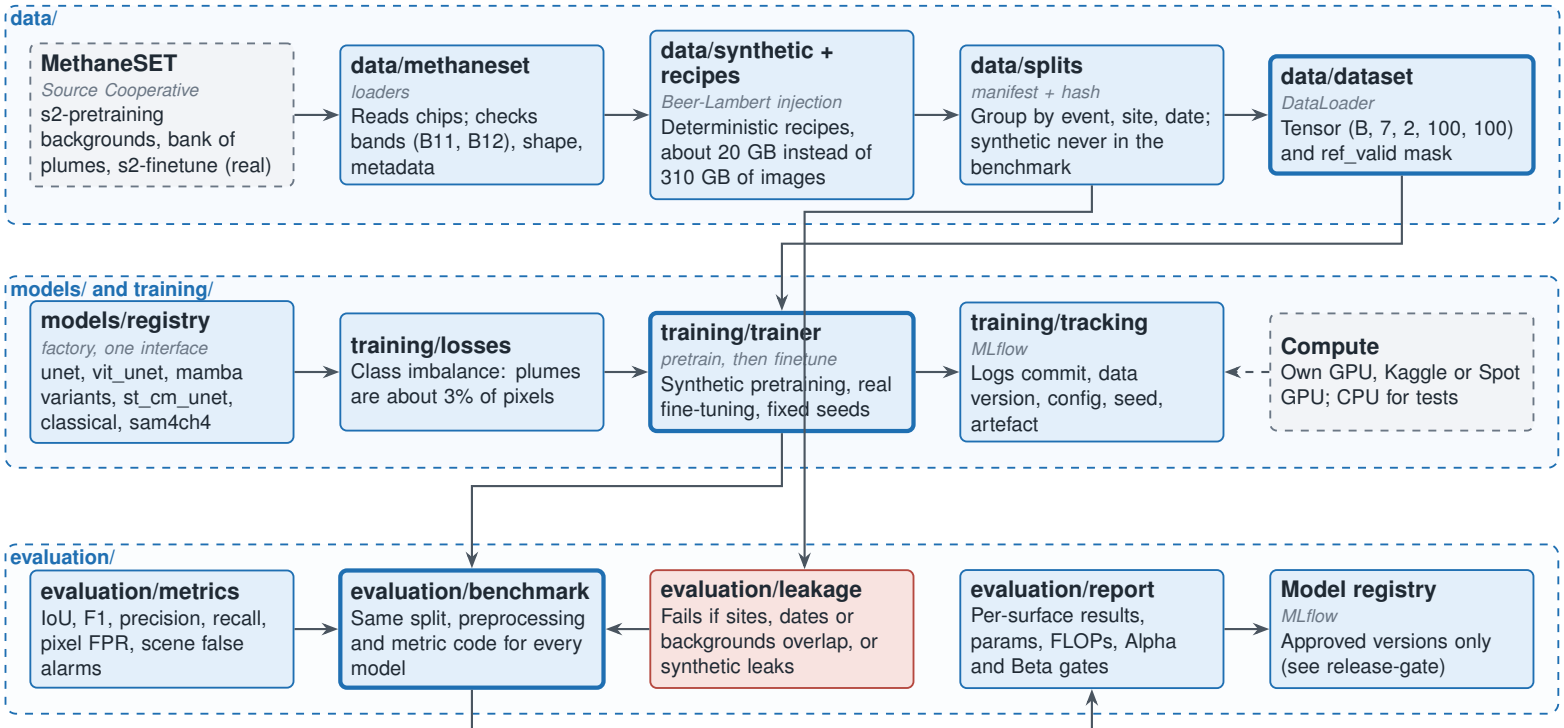
One protocol decides every model: same split, same metrics, same code

Level 02 - ML pipeline. Thick border: the step every other step depends on. Dashed: outside the code.



Rules enforced here (report Section 7.2.1): samples are grouped by emission event and date before splitting; selection and thresholds use validation only; the held-out real test set is used once, after the model and threshold are fixed. U-Net and ViT-U-Net are the principal baselines; Mamba variants are secondary.
