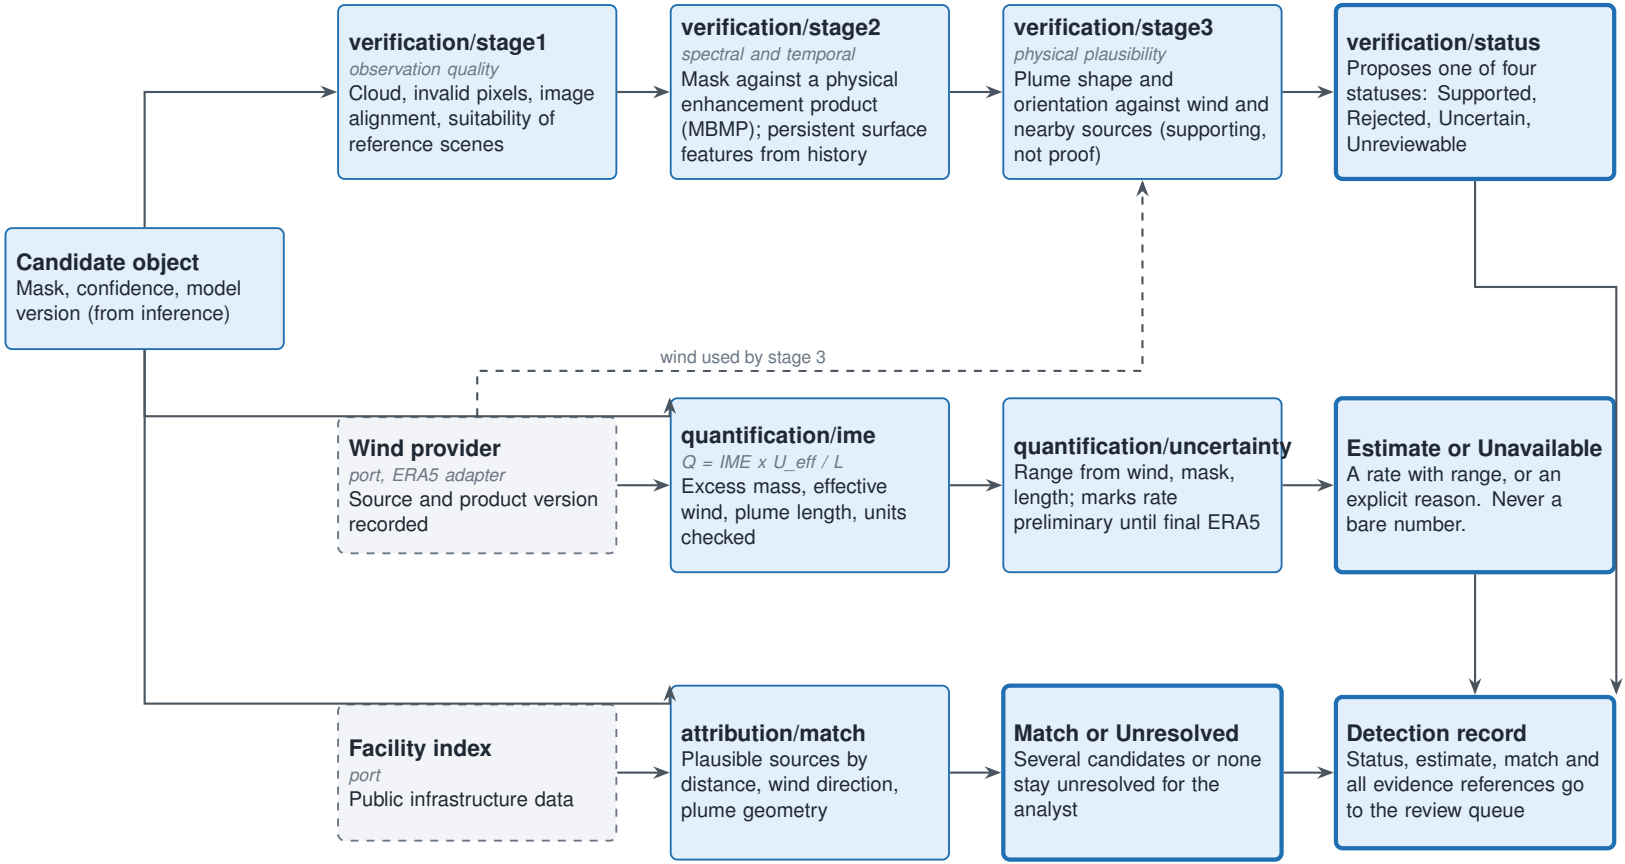
A mask is not a verified emission, and a plume near a facility is not that facility's plume

Level 02 - science chain. Top: verification (FR7). Middle: quantification (FR3). Bottom: attribution (FR3).



Rules from the report: poor observations are screened first; checks that rely on related satellite data strengthen consistency but are not independent confirmation; a rate is reported only when its inputs support it (Section 7.1: Unavailable or Uncertain, never an unsupported point estimate); ERA5 is about 31 km and ERA5T lags by about five days, so the wind source and version are stored with every estimate.
