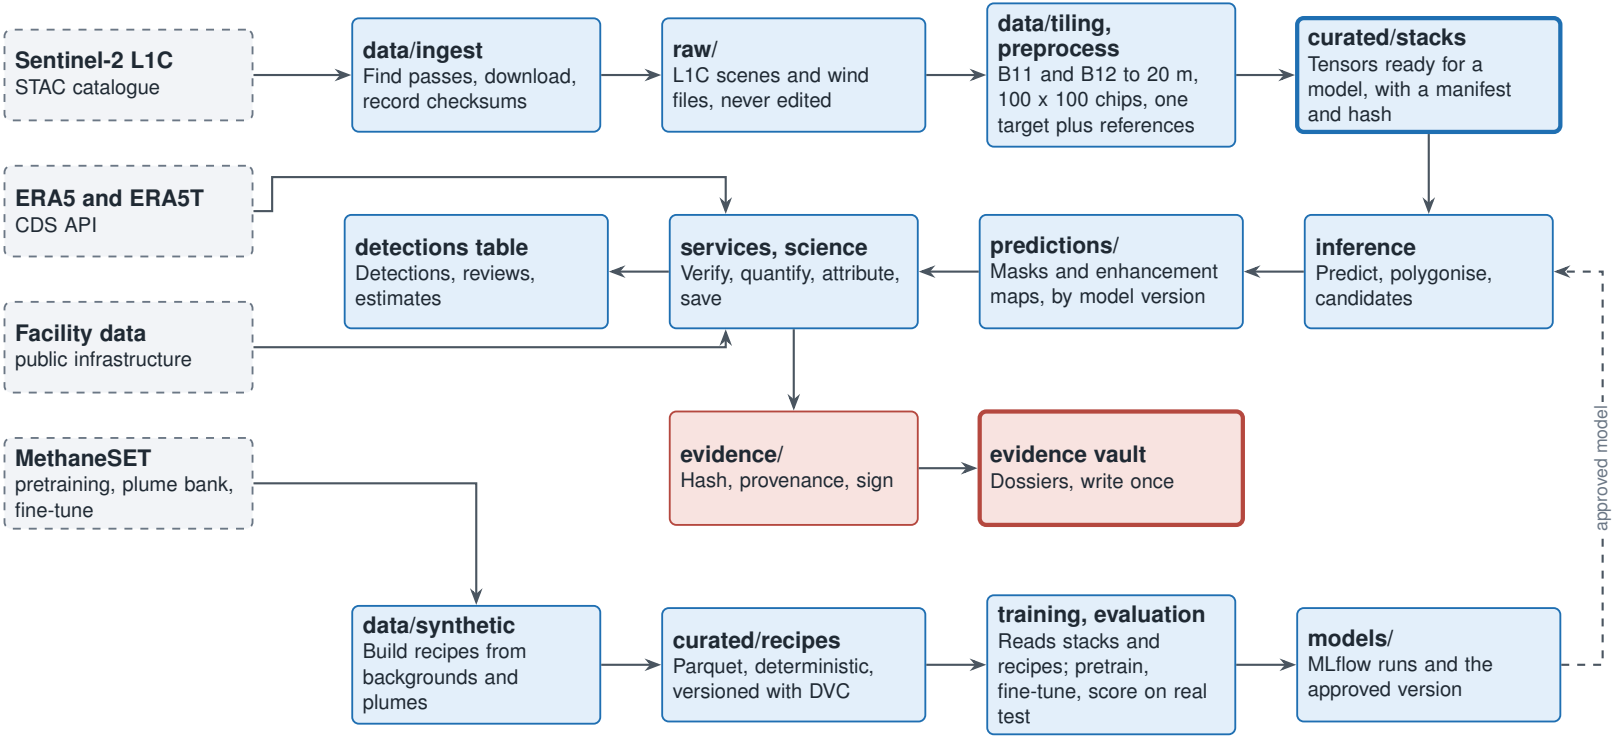
Raw is never edited; everything downstream carries a hash

Level 05 - data flow. Top: the monitoring path. Bottom: the training path. Dashed: the approved model goes to inference.



What is versioned

DVC: curated data, recipes and manifests (hash).
Git: code, configs, release gates.
MLflow: runs, metrics, model versions.

The same preprocessing code builds the stacks for training and for monitoring, so what the model sees in production is what it was evaluated on.
