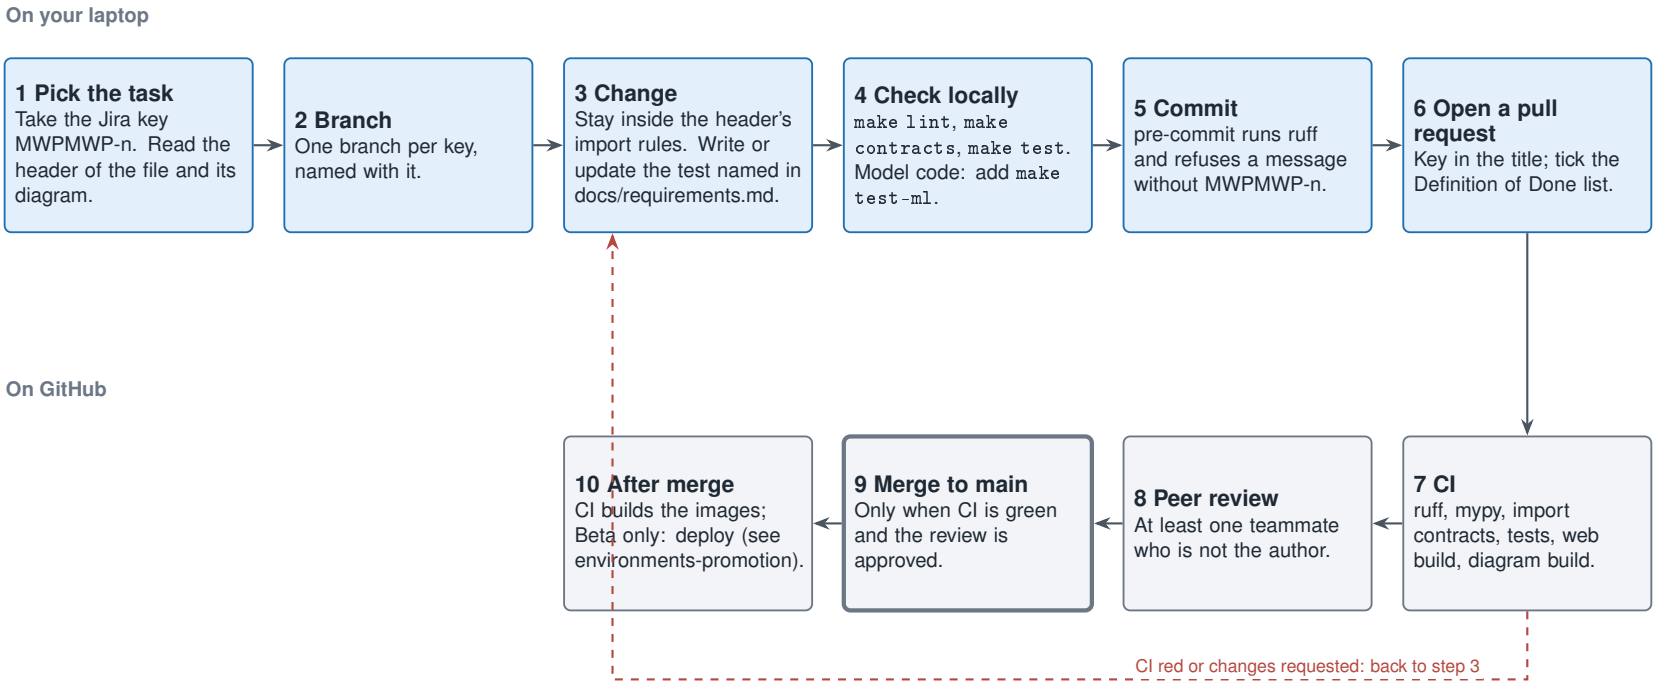
Every change takes the same ten steps

Level 06 - change workflow. Blue: your laptop. Grey: GitHub. Red: what to add when the change touches a rule that must not weaken.



Also do this when your change touches one of these

A model or the trainer	Log the run in MLflow. Promotion is a separate act, only through the release gate (Beta: F1 $\geq$ 0.80, FPR $<$ 0.03%).
Data, recipes or splits	Run `dvc repro`, commit the new manifest hash, update the dataset card. Never put synthetic ids in the benchmark.
The API contract (schemas, routes)	Run `scripts/export_openapi.py` then `scripts/gen_ts_client.sh`; commit both outputs.
`configs/permissions.yaml` or `release_gates.yaml`	Update the test that names the changed cell or number; say why in the pull request. Needs the owner of security (Ha) as reviewer.
A status, estimate or evidence rule	Change the rule test first. Never relax it to make a change pass.
A new package, port or route	Update the matching diagram and run `make diagrams`; add an ADR if it changes a decision.

Branch naming and the exact CI checks are proposals. The Jira key, the Definition of Done and peer review are team rules from the report.
