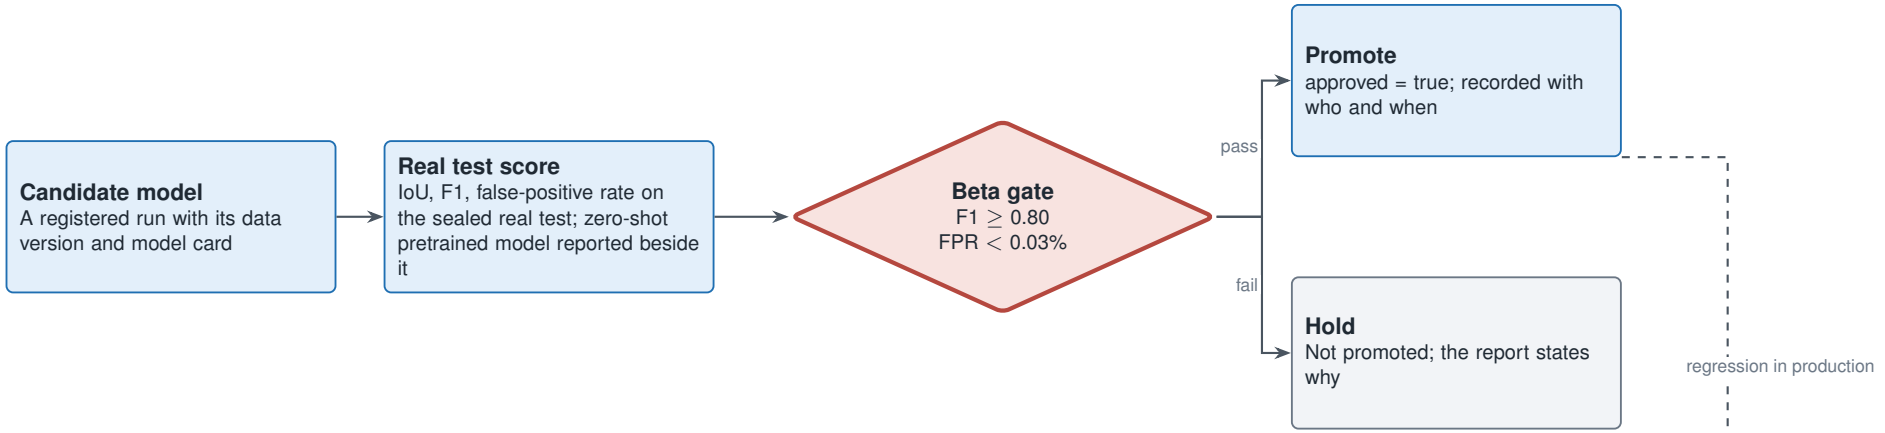
A number in a report is not a permission to ship

Level 06 - release gate. Alpha targets describe research; the Beta gate controls promotion; rollback is the safety net.



Two different numbers

Alpha research targets: IoU ≥ 0.70 and F1 ≥ 0.75 on the real test. Measured and reported for every model in the benchmark. A model that misses them is still a valid result.

Beta promotion gate: F1 ≥ 0.80 and FPR $< 0.03\%$. Applies only to the model that serves users.

They are stored in separate keys of `configs/release_gates.yaml`, so one cannot be read as the other.

Test required: the gate is a function with unit tests (pass, fail, boundary values), and the registry refuses to set `approved` when it returns fail.
